Modeling social media

- Existing works in literature manually **hand-craft features** such as Facebook likes, numbers of shares, and user demographics to train classifiers ('15).
- Modeling **rumor cascades** in social networks as **RNNs** have been proposed recently ('16, '18).
- Hybrid models which consider the **temporal sequence of textual content of social media comments** have also been proposed ('17).
 - These models do not consider the news article text and social media comments holistically.

Problem Description
